

## *Creating a Bass Drop Using Pro Tools*

- Open a mono audio track or use an existing audio track
- Using the selector tool, highlight the region you want the bass drop to occur (experiment with the length of the drop)
- Now using AudioSuite (dropdown menu), open two plugins; Signal Generator (under “other”) and Vari-Fi (under pitch shift). *They need to be open at same time.*
- On SG, use the *frequency slider* to decide what pitch you need according to frequency (click speaker button at bottom *left* corner to hear sample of pitch). Once you find the right starting pitch, run the level up to ZERO dB (you can adjust in your track later); CLICK RENDER (bottom *right* corner)
- NEXT – on Veri-Fi, select SLOW DOWN for change, FIT TO for selection, and ON for fades. CLICK RENDER
- Play it back, you now have a BASS DROP.
- If you don't like it, delete and try again!
